

Slug Pellets KILL!

Hedgehogs, birds and even pets can be killed by eating the pellets or the slugs and snails that have been poisoned

Hedgehogs are under threat from metaldehyde poisoning. By poisoning an important wildlife food source we are also killing hedgehogs and birds. Our wildlife dies a slow painful death after eating the poisoned slugs and snails and its up to us to stop using these chemical killers in our garden.

Consider these hedgehog and bird safe alternatives instead;

Diatomaceous Earth powder is totally organic, cheap and won't harm pets or children, but will kill slugs, snails and ticks on contact by dehydrating them.

BEER sprayed around and in a shallow pot will attract slugs and snails, who drown happy. Beer will also add a nice flavour for the hedgehogs and birds that might eat them.

SEAWEED MULCH contains high levels of salt. Place this around the plants to deter slugs and snails
CRUSHED EGG SHELLS AND COURSE SAND around plants, snails and slugs cant move on these surfaces

BRAN OR PORRAGE OATS will attract the molluscs as a favourite food but the dry food will dehydrate and eventually kill them

Growing Success Advances Slug Killer kills only slugs and snails. There is no secondary poisoning of birds, hedgehogs etc, they are completely safe even if they eat the pellets.
